# CARD evaluation performance

Local measurements of the scoring engine and the /api/evaluate endpoint

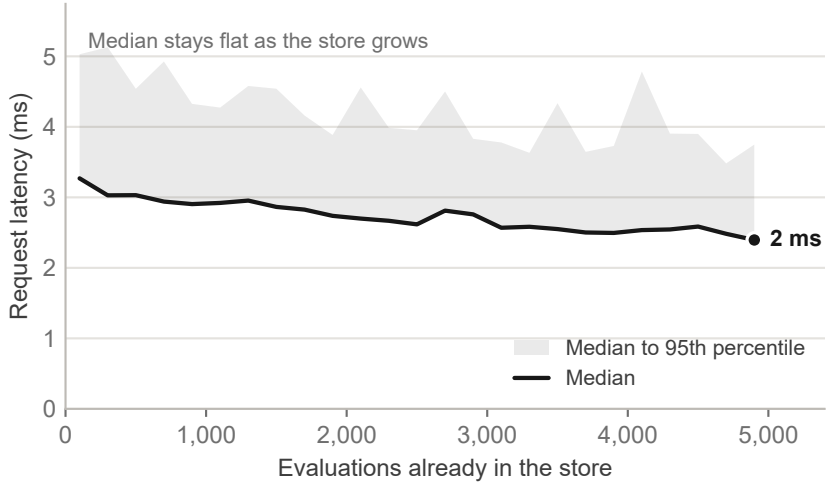

## (a) Scoring engine

evaluateRisk() alone, empty session history, 20,000 runs per type

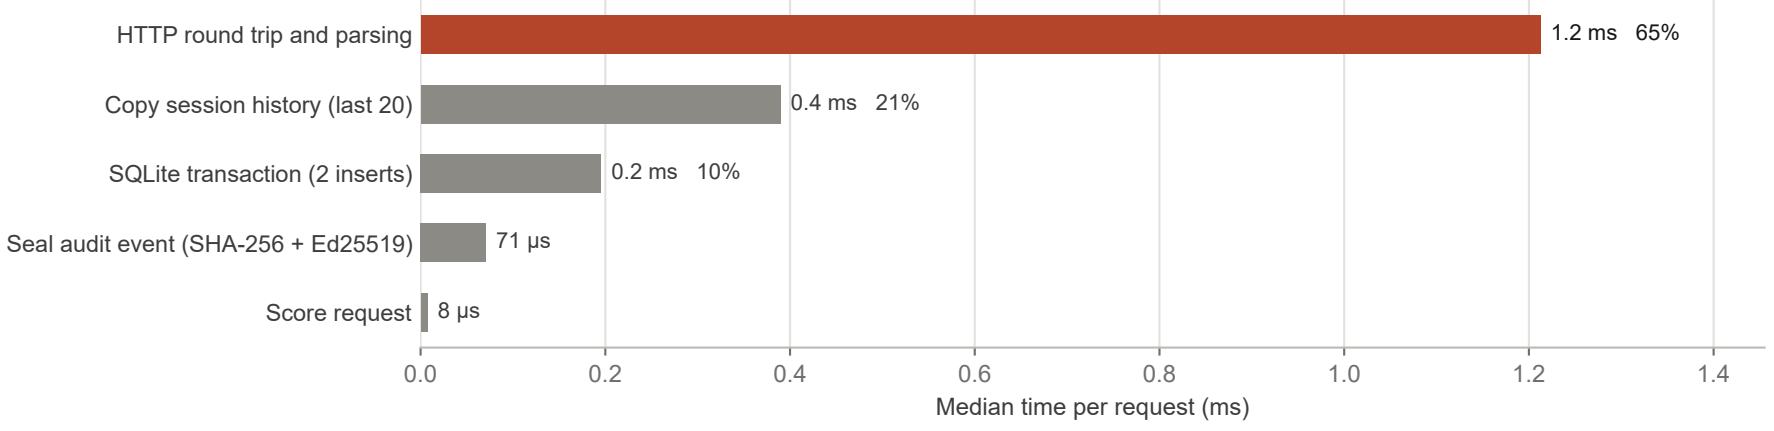

## (b) POST /api/evaluate

5,000 sequential requests over loopback, binned every 200

## (c) Where the time goes at 5,000 stored evaluations

Median of each step timed in isolation; storage: SQLite (node:sqlite, WAL). Percentages are of the summed steps.

Measured 2026-10-29 on AMD Ryzen 5 7520U with Radeon Graphics (8 threads, 15 GB), Node v22.13.1, win32 x64. Synthetic inputs, one request in flight, warm process.
Reproduce with npm run bench, then python scripts/plot_performance.py.
